Correlating Threat with Identity

1/22/2020 Are there multiple streams of video or a single source? What types of video stream - standard video, HD, IR and other formats?

1/22/2020 Will the detection be done at the Edge or it will be processed on the cloud? Are there any size/power limitations?

1/22/2020 Any minimum response time metrics available?

1/13/2020 Are there any further details that could be provided about the level of annotation desired by the end model (I.E. Detect that there is a gun in the frame vs recognize the exact location of the gun in the frame and boundary box it)? This is useful to scope out the models to use that could work in real time on live video feed.
