Would a medical device that improves peripheral nerve healing be appropriate for this topic?

"Thank you for your question.

Unfortunately that type of solution would not be responsive to the solicitation. Although accelerated healing of peripheral nerves following extremity injury is a critical gap, that solution would not necessarily mitigate fall risk. Additionally that is likely more of an acute surgical treatment rather than a rehabilitation treatment."

Would a pharmaceutical that cuts healing and recovery times for bone fractures in half be appropriate for this topic?

"Thank you for your question.

Unfortunately that type of solution would not be responsive to the solicitation. Although accelerated healing of bone fracture is important, it would not necessarily provide a solution to mitigating falls and/or improving performance."
